## Title of project/experiment/activity

Horiba LabRam HR800 Raman spectrometer/ Raman and PL spectroscopy/ Use of Raman spectrometer

Location of activity EEDB Annexe, Ground floor, Raman Spectroscopy Laboratory (Room 82) Start and end dates 23/3/2017 - open-ended

## Brief description (or attach procedure/protocol)

Raman and PL spectroscopy is used for characterizing optical properties of various materials. In this experiment, various lasers can be used (Ar-Kr laser and He-Ne gas laser). The laser light is guided by mirrors and focused on the sample by an objective. During the measurements the laser power on the sample is kept below a few mW. The scattered light coming from the material is guided to the spectrometer, dispersed by a grating and detected by a charge coupled device (CCD) camera. Raman and PL spectroscopy allows to assess structural and electronic properties of a material. Mainly, carbon based materials and other 2d materials will be investigated, such as amorphous carbon, graphite, graphene, graphene oxide and transition metal dichalcogenides.

The LabRam HR800 Raman spectrometer is commercially available and used according to the manufacturers' guidelines.

Hazard	Effect	Control measures	Residual risk
Pinch point	Skin damage, bruises	Care must be taken when changing gratings and filters when opening the hood of the spectrometer to avoid pinched fingers or hitting the head.	Low risk
Lack of visibility (Dark room)	Bruises	The light might be switched off during measurements. There are small reading lamps on each desk. Prior to switching the lights off, users should make themselves aware of the obstacles on the floor, such as ramps, cable covers to avoid stumbling over them, as well as other obstacles, such as chillers and power supplies. Users must familiarize themselves with the locations of the light switches available.	Low risk
High power lasers, class 3B and 4	Skin damage, burns, eye damage	All beam paths are fully enclosed to prevent the risk of someone being exposed to direct, scattered or reflected laser light. The laser power is reduced significantly and all jewellery has to be removed when alignment work is carried out. Appropriate laser safety goggles must be worn while aligning. Observers (visitors) must wear laser safety goggles at all times while the alignment is done. An interlock system is installed and must be switched on when switching on any laser. The lamp outside the lab indicates if a laser is on or not. A code has to be entered to open the door to override the interlock and open the door, while lasers	Low risk

## **Department of Engineering – Risk Assessment**

are on.

Ref No.

Electrical Snock	Snock to user	(water cooled Ar ion laser and Ar-Kr laser)	LOW risk
		Thater cooled his follower and his his lasery	
Personal Protecti	ve Equipment requ	uired [eye/face protection, respiratory protection, gloves, lab cod	nt etc]
While aligning, ap	propriate laser saf	fety goggles must be worn.	
Emergency Instru	ictions & First Aid		
Fire: In case of fir	e, the fire alarm sh	ould be activated and fire service called. Evacuate the building.	
Any special moni	toring required [e.	g. hearing test, vibration monitoring, health surveillance]	-1 4000
N/A			
Further control m	neasures required?	? If yes, list with actions.	
N/A			
Biological/Laser/	Radiation Approva	al (requires relevant Specialist Safety Officer signature and date)	
Class 3B and 4 las	ers are being used		
Signature of Depar	tmental Laser Office	er:	
		Date:	
Out of hours/Lon	e working		
Out of hours wo	rking must be auth	norized according to Engineering Department regulation.	

Signature to confirm that this is a suitable and sufficient assessment of risk and that stated control measures are in place. This risk assessment should be reviewed if additional risks not covered in this assessment are identified or if there is any reason to indicate that the control measures are insufficient.
